Yearly energy report - 2024**

Energy usage from Year 2024.

The breakdown of the consumption by energy source

The breakdown of the consumption by area

Yearly Energy Report

In 2024, the construction of the BMW Group's site in Debrecen continued. Most of the buildings were completed by the second half of the year, and the installation and commissioning of the manufacturing technology began. As a result, the share of this activity within the total energy consumption showed a continuous increase.

In parallel with the development of the infrastructure, the Organization's energy consumption increased seven and a half times compared to the previous year in 2024, of which 95% was electricity, covered by guarantees of origin.

In 2024, although both the infrastructure and the organization underwent dynamic changes, we carried out the large enterprise energy audit required by the 2015 LVII Energy Efficiency Act for the already operational buildings. During this process, the external audit team identified numerous potentials and defined a total of 20 measures with potential savings of approx. 820 MWh.

Some of these measures have already been implemented by the Organization, while the remaining are currently under review.

Development of the Site's Energy Demand
